About me: Coding for me is like solving a captivating puzzle. I find joy in cracking challenging problems and devising innovative solutions. Every new programming language or framework I learn opens up new possibilities. I am deeply passionate about coding and see it as an opportunity to blend creativity with logic.

Project Description:

It is a multi-user app (requires one admin and other service professionals/ customers) which acts as platform for providing comprehensive home servicing and solutions.

How I Approached the Problem Statement:

Firstly, having a prior knowledge of MAD1 theory gave me a strong boost to my project journey. I have taken help from previous year project sessions and bootcamps which were available in the YouTube.

At first, I created login and register page for both customer and professional, and only login page for admin. Then I thought about database model and while creating I got lots of error at first it is annoying but after some time it is adjustable and so on, I created routes for the application based on core functionalities, then I developed all the templates and provide proper rendering and finally completed after lots of hard work and time.

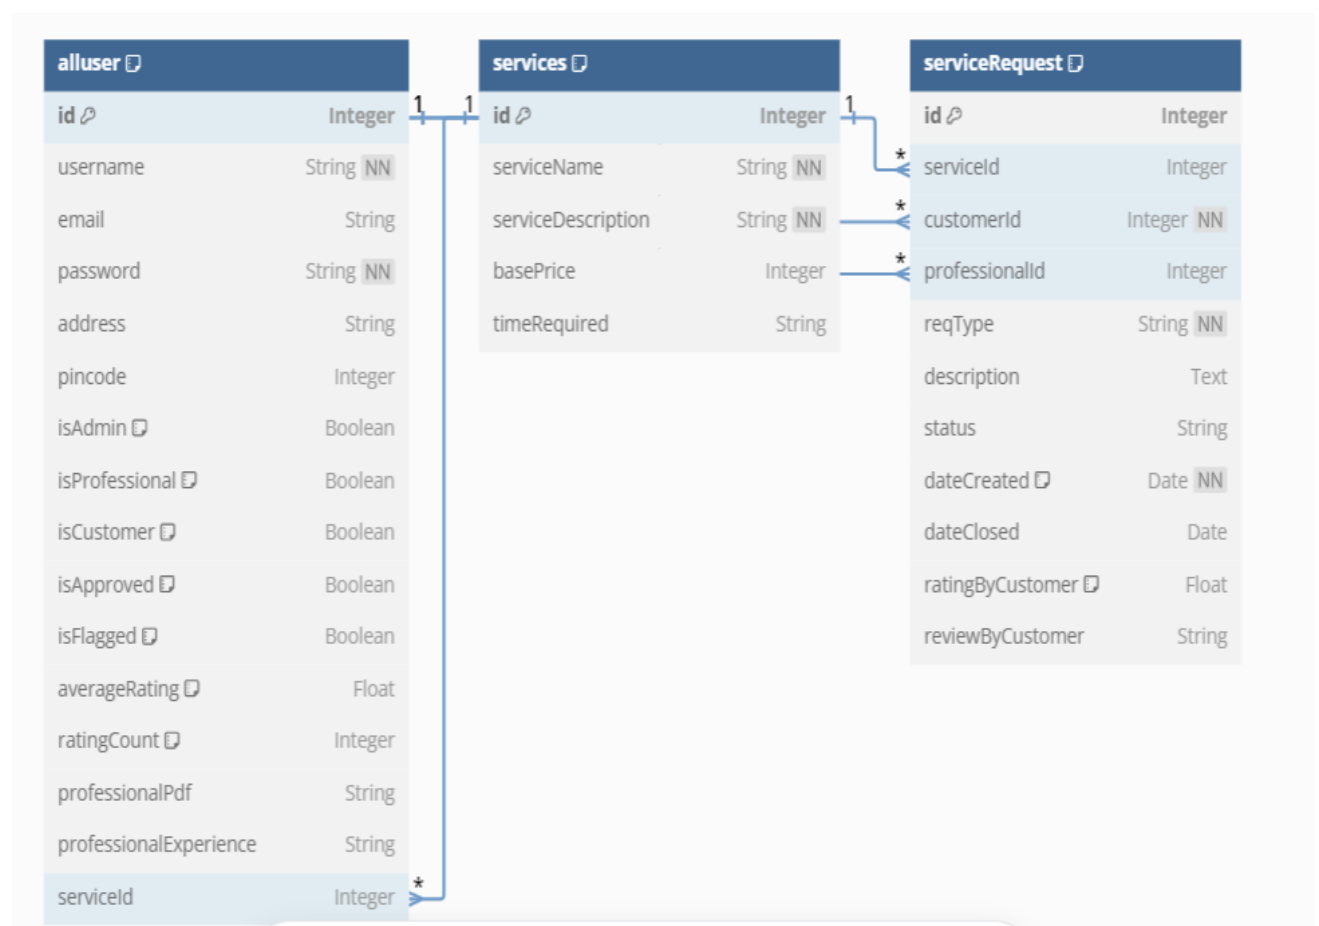

Technologies Used:

1. Flask: Backend framework for building the web application.
2. SQL Alchemy: ORM (Object-Relational Mapping) tool for database interactions.
3. SQLite: Database Management System for storing data.
4. HTML/CSS/Bootstrap: Frontend for styling.
5. Datetime: Python library for handling date and time operations.
6. Jinja2: Template engine for rendering dynamic HTML content.

7. Werkzeug: Utility for securely managing passwords and authentication.
8. Matplotlib/Seaborn: User for creating different types of charts on the admin dashboard.

DB Schema Design

The database schema has three tables alluser, services, serviceRequest connected with foreign key id figured below.
